ProActive—simplifying ISO systems

ProActive System Build Options

ProActive **'full system build'** packages are designed to provide system implementation and accredited certification within as little as six weeks subject to assessor availability. Full build packages are ideal for organizations seeking genuine business performance improvements and rapid certification, often removing pre-qualification barriers. Alternatively our full system build service is ideal where client experience with ISO systems may be limited.

ProActive **'Assisted system build'** packages are for organizations capable of implementing a certification project but where structured assistance may be required to fill gaps in experience or competence.

Assistance varies from client to client depending on client experience. Typically consultant assistance might include the setting up of key processes, setting up procedures, facilitating SMART performance objectives, establishing environmental controls, completion of internal audits, risk assessments etc. Structured assistance requirements are agreed during opening discussions with the client.

If ProActive appears right for your organization why not call us for a no obligation discussion. Lots for your organization to gain and nothing what so ever to lose!

Making ISO business systems work for you
